Caution: freshly generated snowdrift accumulations

Danger Level 2 - Moderate

Tendency: Increasing avalanche danger
on Sunday 8 December 2024

Wind slab

Starting at midday, avalanche danger is expected to rise.

Danger assessment

As a result of fresh fallen snow and frequently storm-strength NW winds, fresh snowdrifts are accumulating. The fresh snowdrifted masses can easily be triggered above 2400m in all aspects, or else trigger naturally, particularly at the foot of cliffs and behind protruberances in the landscape along the Salzburg border in those regions where there is lots of wind. Avalanches are medium-sized in isolated cases. Apart from the risks of being buried in snow masses, also the danger of being swept along and being forced to take a fall need to be considered.

Snowpack

Danger patterns

dp.6: cold, loose snow and wind

From place to place, 5-15 cm of snowfall is anticipated, locally more. Winds will be blowing intermittently at storm-strength. Freshly generated snowdrift accumulations are poorly bonded with each other and with the old snow. The upper layers of the snowpack are soft; the lower layers are faceted.

Weather

On Friday, widespread cloudbanks will pass through in high-altitude layers, snow showers can be expected. Winds will be moderate to strong, initially from the southwest, then shifting in the afternoon to westerly-to-northwesterly. For a brief interim, temperatures will rise. At 2000m: -2 degrees, at 3000m: -6 degrees.

Tendency

Forecasts of developments, including of avalanche danger, are still uncertain.
