

Avalanche bulletin Bavaria

Thursday 19 December 2024

Published 18 Dec 2024, 17:00:00
Valid from 18 Dec 2024, 17:00:00 until 19 Dec 2024, 17:00:00

Danger Level 1 - Low

Heed risk of taking a fall in steep terrain.

Danger assessment

Avalanche danger is low. Small wet loose snow avalanches can release spontaneously on very steep sun-exposed slopes. Isolated glide snow avalanches can release on steep smooth grass-covered slopes.

Snowpack

The snowpack is thoroughly moist. A thin melt-freeze crust can form during the night which the sun will soften again during the day. The snowpack is wet where it touches the ground, i.e. it can start gliding over smooth ground. Snow depths vary. Ridges and crests are blown bare; south-facing slopes are becoming increasingly bare. All in all, there is little snow.

Tendency

Hardly any changes of avalanche danger by Thursday. After Thursday, avalanche danger will rise due to forecast snowfall and wind.
