# Avalanche report for Monday, 10.04.2023

**Totes Gebirge, Dachsteingebiet, Ennstaler Alpen, Rottenmann Tauern, Nördliche Wölzer Tauern, Schladminger Tauern Nord**

daytime cycle of naturally triggered avalanche activity

## Due to higher daytime temperatures: naturally triggered avalanches

Avalanche danger is low. Main danger. naturally triggered wet-snow avalanches. Due to higher daytime temperatures, small wet loose-snow avalanches can be expected. Slabs are possible only by large additional loading above 2200m in northern aspects. Fresh snowdrift accumulations lie on E/S facing slopes near ridgelines above 2200 m.

### Snowpack structure

The fresh snow and freshly generated snowdrift accumulations are forfeiting their firmness due to higher daytime temperatures. The snowpack fundament was moist up to 2200 m in all aspects and is largely stable.

### Weather

Easter Monday in the Northern Alps will start with clouds and fog, on the southern flank of the Alps it will be sunny. During the morning the sun will take over the reins everywhere. As of midday in the rimline ranges and in the Mürzsteger Alps, a few harmless clouds. It will remain dry. From the west, temperatures will rise. At 2000 m at midday in Totes Gebirge: 0 degrees; in the Hochschwab Massif, -3 degrees.

### Outlook

On Tuesday a perturbation will arrive from the northwest. In SW regions, a bit of sunshine, then in Upper Styria rainfall will set in, the wind shift to northwesterly. In the afternoon the snowfall level will descend to nearly 1200 m.

No significant change in avalanche danger levels is expected.

thin, small snowdrift accumulations

## Low avalanche danger, but caution urged towards wet slides

Avalanche danger is low. Nevertheless isolated danger zones in the form of freshly generated small snowdrift accumulations occur at high altitudes. As a result of higher daytime temperatures, naturally triggered slides can be expected, but releases will be small, the danger of taking a fall outweighs that of being buried in snow.

### Snowpack structure

At high altitudes, depending on aspect and landscape, older snowdrift mases or loose snow atop a melt-freeze encrusted snowpack fundament, lie deposited. The snowpack fundament has already been fully moistened, is currently stable. East of the Schöckl there is very little snow on the ground.

### Weather

Easter Monday in the Northern Alps will start with clouds and fog, on the southern flank of the Alps it will be sunny. During the morning the sun will take over the reins everywhere. As of midday in the rimline ranges and in the Mürzsteiger Alps, a few harmless clouds. It will remain dry. From the west, temperatures will rise. At 2000 m at midday in Totes Gebirge: 0 degrees; in the Hochschwab Massif, -3 degrees.

### Outlook

On Tuesday a perturbation will arrive from the northwest. In SW regions, a bit of sunshine, then in Upper Styria rainfall will set in, the wind shift to northwesterly. In the afternoon the snowfall level will descend to nearly 1200 m.

No significant change in avalanche danger levels is expected.
