Avalanche report for Thursday, 27.04.2023

Totes Gebirge, Ennstaler Alpen, Hochschwabgebiet, Mürzsteiger Alpen, Schladminger Tauern Nord, Nördliche Wölzer Tauern, Rottenmanner Tauern, Eisenerzer Alpen, Schladminger Tauern Süd, Südliche Wölzer Tauern, Gurktaler Alpen, Seckauer Tauern, Dachsteingebiet, Seetaler Alpen, Stub- und Gleinalpe, Korralpe

fresh snowdrifts at high altitudes on ridgeline slopes, behind abrupt drops in the terrain

Heed: small fresh snowdrift masses at high altitudes

Avalanche danger is low. The few danger zones occur mostly near ridgelines and behind abrupt drops in the terrain on shady and east-facing slopes above 2000 m. Wet loose-snow avalanches are possible on extremely steep slopes.

Snowpack structure

Moderate-to-strong NW winds are generating small snowdrift masses, not well bonded with the old snowpack surface esp. on shady slopes, thus, prone to triggering. At intermediate altitudes the snowpack is losing its firmness due to warmth.

Weather

On Thursday, a little bit of everything. Sunny phases, then dense clouds, some rainfall, some snowfall, in other words, April weather. The snowfall level will ascend to nearly 1600 m during the day. At 2000 m: -2 degrees, milder in the evening.

Outlook

Friday: a warm front will bring precipitation and higher temperatures at all altitudes. Gray skies from the start, the peaks hidden in dense cloud. In the Dachstein region rainfall and snowfall in the morning, later spreading to other regions. Snowfall level will ascend to 2200-2400 m by afternoon, the amounts of precipitation will be minor.

The wet-snow problem will intensify somewhat.
