

## Main danger: glide-snow avalanches. Favourable conditions for winter sports enthusiasts.

- 
Voralpenbereich, Allgäuer Alpen, Bregenzerwaldgebirge

- 
Lechquellengebirge, Lechtaler Alpen, Verwall, Silvretta, Rätikon Ost, Rätikon West

### Avalanche problems

### Danger ratings

### Expositions

**Voralpenbereich, Allgäuer Alpen, Bregenzerwaldgebirge**

forest lanes, steep grassy slopes, hillsides, increasing small wet avalanches during daytime

>1800 m steep ridgeline shady terrain

**Ongoing glide-snow avalanches, increasing wet slides during the day. Favourable conditions for sports.**

In steep terrain which has not yet discharged, in forest lanes, and on smooth grassy slopes in all aspects, glide-snow avalanches can continually be expected. Solar radiation and markedly higher temperatures will make small wet avalanches possible esp. on sunny slopes. Older drifts can still be triggered as small-to-medium slab avalanches by persons. Such danger zones occur at high altitudes in shady, steep ridgeline terrain. Beware the risks of being swept along and forced to take a fall!

**Snowpack structure**

The recent fresh snow has settled and is well bonded with the often melt-freeze encrusted old snowpack. The uppermost layers are still soft, esp. on shady slopes. Older often blanketed snowdrifts are sometimes still prone to triggering. At intermediate altitude the snowpack is often moist down to the ground. Gliding movements are still possible in steep terrain where the snow has not discharged yet. At low altitudes the snowpack has deteriorated.

**Weather**

Nocturnal hours: relatively clear skies. Monday: Very sunny and mild, only few thin cloudbanks. Zero-degree level will ascend to 3500 m. At 2000 m: 3-9 degrees. Light winds.

**Outlook**

Also Tuesday will be very sunny and very mild. Gliding snow activity will increase again, also wet loose-snow avalanches. The danger of dry-snow avalanches will decrease.
